

TACE_CHATGPT_MEMORY_2026-07-12

Project Identity

TACE (Theory of Actualized Conscious Experience) is being developed as a formal Aristotelian-Thomistic ontology intended to provide an authoritative metaphysical framework capable of integrating philosophy, theology, consciousness, mathematics, and contemporary physics without reducing one domain to another.

The ontology itself is authoritative. AI systems, scientific literature, and external sources are evidential contributors but never authoritative modifiers of the ontology.

Current Architecture

Principal Ontological Domains

- God (Necessary Being)
- Logos
- Matrix
- Q-Form
- Realm of Forms
- Physical Realm
- Silver Bridge
- Soul
- Acts of Consciousness
- Actual Qualia
- Experienced Reality

The ontology preserves a strict distinction between:

- Necessary Being
 - Created Formal Principles
 - Created Substances
 - Acts
 - Relations
 - Operational Semantics
-

Current Canonical Principles

Matrix

The Matrix is the universal created formal order governing admissible actualizations.

The Matrix is neither conscious nor causal by itself.

It defines the lawful structural constraints within which created actualizations occur.

Q-Form

Q-Form is the universal ontological principle of structured potentiality governing admissible actualizations within the Physical Realm.

Q-Form is invariant.

It is not identical with any particular physical realization.

q-form

A **q-form** denotes the concrete physical-realm realization associated with a substance at a particular stage of its ontological history.

Examples:

- electron before interaction
- electron after interaction
- neuropsychical thought before expression
- neuropsychical thought after expression

Successive actualizations modify:

q-form₁

↓

q-form₂

↓

q-form₃

while preserving the identity of the substance whenever no substantial change occurs.

The distinction between **Q-Form** and **q-form** is now canonical.

Silver Bridge

The Silver Bridge remains the Universal Onto-Epistemological Isomorphic Principle of Creation.

Recent development has considerably enriched its operational semantics.

Its canonical identity remains unchanged.

Its operational understanding has expanded.

Silver Bridge Operational Modes

Three operational modes are now recognized.

Non-Intentional Actualization

Lawful mediation of natural actualizations without participation of an Act of Consciousness.

Examples:

- electron-photon interaction
 - chemistry
 - biology
 - astrophysical processes
-

Intentional Determination

Lawful mediation through which an Act of Consciousness intentionally apprehends one determinate intentional Form from the coherent manifold of admissible neuropsychic realizations.

Intentional Embodiment

Lawful mediation through which a determinate intentional Form becomes embodied into neuropsychical realization, enabling communication, language, memory, symbolic representation and purposive action.

These are operational modes of the Silver Bridge.

They are not independent ontology concepts.

Transparentation

A new explanatory notion has emerged.

Transparentation describes the lawful mediation performed by the Silver Bridge whereby one and the same intelligible identity becomes present under different ontological modes without loss of identity.

Transparentation is explanatory terminology rather than a canonical ontology concept.

Ontological Non-Locality

The distinction between physical locality and intentional existence has been significantly refined.

Physical substances exist according to localized space-time realization.

Intentional objects exist according to an ontologically non-local mode of existence proper to consciousness.

This non-locality is ontological rather than physical.

It should not be identified with quantum non-locality.

Dual Ontological Presence

One and the same object may simultaneously possess:

- localized physical presence within the Physical Realm;
- non-spatial intentional presence within consciousness.

The Silver Bridge mediates the lawful isomorphic correspondence between these two modes of presence while preserving identity.

Topological and Intelligible Geometry

The Silver Bridge mediates lawful correspondence between:

Topological Geometry

Intelligible Geometry

The object preserves identity while changing its ontological mode of realization.

Bell-Type Correspondence Hypothesis

Current research hypothesis:

If intentional objects, as actualized intelligible Forms present to consciousness, possess an ontologically non-local mode of existence distinct from the potential mode of structural Forms, it is worth investigating whether this mode admits mathematical structures analogous to Bell-type correlations.

Should telepathic phenomena be empirically demonstrated, TACE would provide a coherent ontological framework within which they could be investigated as possible manifestations of ontological non-locality mediated by the Silver Bridge rather than as violations of physical locality.

This remains a research hypothesis.

It is not a canonical ontological claim.

Ontology Governance

Recent methodological conclusions:

- Prefer semantic enrichment over concept proliferation.
 - Introduce new canonical concepts only when irreducible semantic content is required.
 - Operational refinements belong within existing concepts whenever possible.
 - Canonical definitions should remain concise.
 - Rich operational semantics belong in dedicated operational sections.
-

Current Research Directions

- Mathematical formalization of the Silver Bridge.
- Formal semantics of transparentations.
- Dynamic evolution of q-forms through successive actualizations.
- Formal treatment of ontological non-locality.
- Possible mathematical correspondence with Bell-type structures.
- Canonical transformation engine.

- Formal ontology inference rules.
 - Semantic validation against the authoritative ontology.
-

Software Status

PRETACE is evolving toward:

- authoritative ontology repository;
- semantic reasoning engine;
- canonical transformation pipeline;
- ontology governance system;
- persistent semantic project memory.

The long-term objective is a local-first AI assistant governed by the TACE ontology rather than by statistical language models alone.

Open Questions

1. Formal mathematical definition of q-form evolution.
 2. Mathematical representation of the Silver Bridge.
 3. Formal semantics of intentional determination.
 4. Relationship between topology and intelligible geometry.
 5. Formal definition of ontological non-locality.
 6. Whether Bell-type mathematical structures provide an appropriate formal analogue.
 7. Development of executable inference rules for TACE.
-

Guiding Principle

The preferred evolution of TACE is semantic deepening rather than conceptual proliferation.

Whenever a newly discovered phenomenon can be completely expressed by enriching the definitions, properties, operational modes, relations or inference rules of existing canonical concepts, no new canonical concept should be introduced.

Immediate Next Objectives

- Consolidate the Silver Bridge revision.
- Integrate the Q-Form/q-form distinction into the ontology.
- Formalize transparentation.

- Introduce operational semantics for the three Silver Bridge modes.
- Continue the mathematical development of intentional geometry and ontological non-locality.
- Begin formal axiomatization of the enriched ontology.
